

Form Fits Function

During the Experiment:

What is the easiest utensil to use to pick up the small objects?

What is the easiest utensil to use to collect the water?

What about the shape of the utensil made it the best for scooping up the water?

Make observations about which utensils are most useful to collect certain objects.

Reflection and Application:

Think of examples where animals have certain body parts to help them do something specific.

- Ex: Ducks have flippers to swim. These wouldn't be helpful if they lived in a desert.

Do you have any adaptations that make being a kid easier?

-
